

Abstract and Interfaces Activity

Create a project **abstractAndInterfaces** with 2 *packages*: **abstractClasses** and **interfaces**.

In the **abstractClasses** package, create:

- an abstract class with at least one abstract method
- 2 subclasses that inherit from it and implement the abstract method
- a test class that
 - instantiates the subclasses
 - calls the abstract method for each subclass instance
 - prints the results of the method

In the **interfaces** package, create:

- an interface with at least one method
- 2 classes that implement the interface
- a test class that
 - instantiates the 2 classes
 - calls the interface method for each class instance
 - prints the result of the method

Zip the **project folder** and submit to Canvas.
