

Testing Activity

Create a project called **testActivity**.

Choose a class from one of the previous examples or projects and copy it into the project src folder.

Write test cases for **two** of the class's methods.

For example, make an instance of the the Student class, create a student object with appropriate arguments for the constructor, then call assertEquals() on the getName() and getID() methods. Use values that will fail the first time, then change them to the correct expected values and make sure it passes.

Create a test folder for the tests.

****If your version of IntelliJ IDEA does not have a directory option in File/New:**

- create an empty folder on the desktop named “tests”
- drag and drop the tests folder to the **project name** in IntelliJ, **not** into the src folder
- see the beginning of the video for an example

Zip and submit the **project folder**, which should include the class in the src folder and the test folder.
