File Reading & Writing Activity

Create a java project **fileActivity**.

1. Create a **text file** *similar* to **courses.txt** in the assignment example code.
   - **You can create and write a text file in the project by right clicking the project name, selecting *New*, selecting *File*, writing the file name, and then selecting *Text* as the file type.**
   - Once the file is created, you can write the file contents similar to the example *courses.txt*.

2. Create a class **FileRead** that
   - has a try/catch statement
   - reads the text file
3. Create a class **FileWrite** that
   - writes a header for the file
   - asks the user for input data
   - writes the input under the appropriate headers
4. Create a class **FileAppend** that
   - asks the user for more values
   - writes the values to the existing text file
